## DECLARE WAR ON OUR COMMON ENEMY

In the battle to prevent deep vein thrombosis, the HemaFlow Sequential Compression Device (SCD) is your weapon.

## Mechanical Prophylaxis for DVT Protocol Made Simple

**Portable and Lightweight** Increase patient compliance with a portable sequential device that eliminates the use of tubes and hoses.

**Visual** Verify the pressure being applied to the lower extremities.

**Limited Complications** Unlike prescriptive drugs, HemaFlow helps mitigate the risk of bleeding and does not require weekly blood monitoring.

HemaFlow allows a multimodal approach for venous thromboembolism (VTE) for high-risk orthopedic surgery patients. Current board guidelines indicate that aspirin is not appropriate as the only option for the prevention of DVT.

HemaFlow fits into the change in healthcare. The Deficit Reduction Act of 2005 requires hospitals to identify Hospital-Acquired Conditions. DVT and Pulmonary Embolism fall underneath this act which may result in penalties and payment reductions.

HemaFlow is covered by most insurance plans. Private Pay Organizations recognize the significant cost savings when a patient does not have to be readmitted to a hospital. HemaFlow fits into protocol driven medicine.
